

DOCUMENT PRODUCTION FROM A SEARCH ENVIRONMENT

5 A method of presenting search results (104) obtained from a search conducted over a
computer network (720) is disclosed. The search is performed using searching criteria
(102) and returns information including a plurality of network locations (106). Data is
extracted (438) from a first one of the network locations and examined 442) to identify
therein the searching criteria to provide at least one specific location (444) within the first
network location of the searching criteria. The specific location is used to identify, from
10 the extracted data, specific data (452) including at least the searching criteria. The
specific data is then formatted a printable document (454). Preferably, the steps are
repeated for each remaining network location in which the formatted data is incorporated
into printable document. Typically, the formatted data spans at least one printable page
thereby allowing identification of one or more locations (304) where the pages are void of
15 formatted data. In such instances, further data (524) can be sourced from the computer
network formatted and incorporated at least one void location within in the printable
document.
